Assignment

Once you've read about case, number, and class, find three natural languages in the real world and tell me about how they handle these three topics (or if they handle them at all). Your three languages must not be related (should be from different language families) and must not be languages that you already speak. You should be able to find the information you need from Wikipedia.

Once you've collected your data, share it with me through DMs.

(The purpose of this assignment is to practice describing parts of a language, which will help you document your own conlang. This is will also be good practice for finding general information and inspiration for your conlang.)
